Introduction to Git & Github

→ so before learning Git and Github we have to know Version control system (VCS)

* Version control System (VCS)

→ it is a software which keep track of file changes (add / delete / modify) overtime.

→ it will allow multiple people to work on same project

→ common VCS are

1. Git
2. Apache Subervision (SVN)
3. Mercurial

What is Git ?

→ Git is a version control software which will be in local machine (Computer) which will keep track of folder changes overtime

↖ Any file / Any Folder

what is Github ?

→ github is a cloud version of Git, which can store all files / folders of local → Cloud So that we can share folders to Anybody.

What is Folder & Repository

→ when we are working with some files in our local computer it will be called as folder

→ if that folder was tracked by Git Then it would be calling as a Repository

Basic Git commands & terminologies

1) Git init → If we run this command in any folder means we are monitering folder using git, Converting from Folder → Repository

2) When we are working with Git we have 3 areas

1) working → we will be writing all files and make changes in every file we want in local Repository

2) Staging → selecting the important files and folders from working directry and keeping those.

3) Commit → uploading all selected Files and Folders to the Cloud Repository

git add . → adding all files to staging Area

git commit -m " " → commiting all changes made

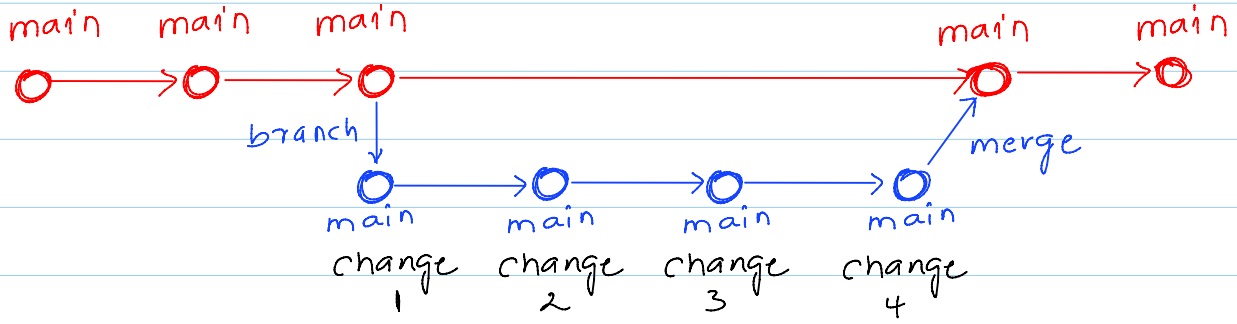

git push → pushing all Files to remote cloud Repository

git log → viewing all commited history we have done so far

Very Important concepts in Github

Branches → we will gonna create a seperate branch we will not distrub original branch

→ if we satisfies with branch we have created we will Merge with original

pull Requests → after dividing main branch into different sub branches and made different modifications

→ combining those different branches to one main branch is called as "pull requests"

→ if i am employe having a branch and i made changes and wantcd to push changes so ill send a "pull request" to the master (owner)
