→ if we want to get an editor when we are writing a commit message

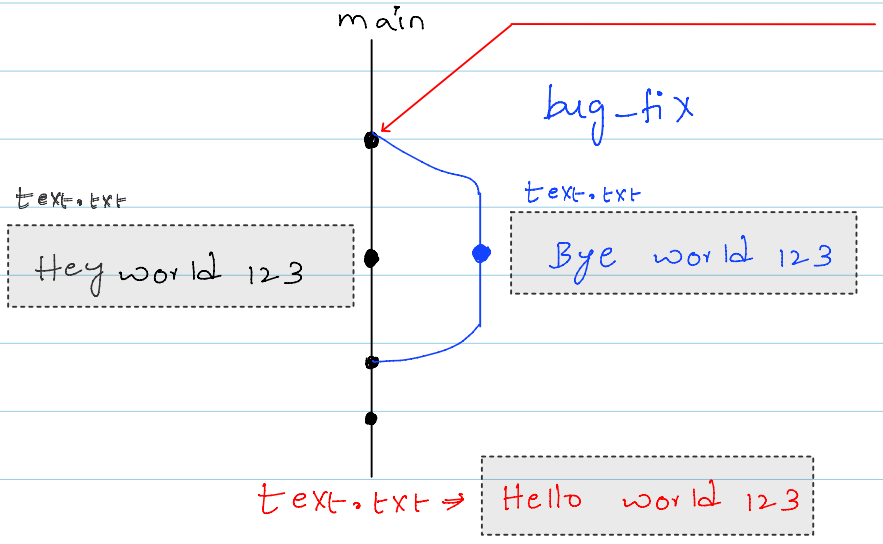

» git config --global core.editor "code --wait"

Merge Conflicts

→ a merge conflict occurs when two branches change / modify / add to the same resource in same directory

→ for example create a conflict

→ There is a file text.txt with initial data of Hello world 123

→ So after commiting change our file will look like this

But main added some data and bug_fix added some data

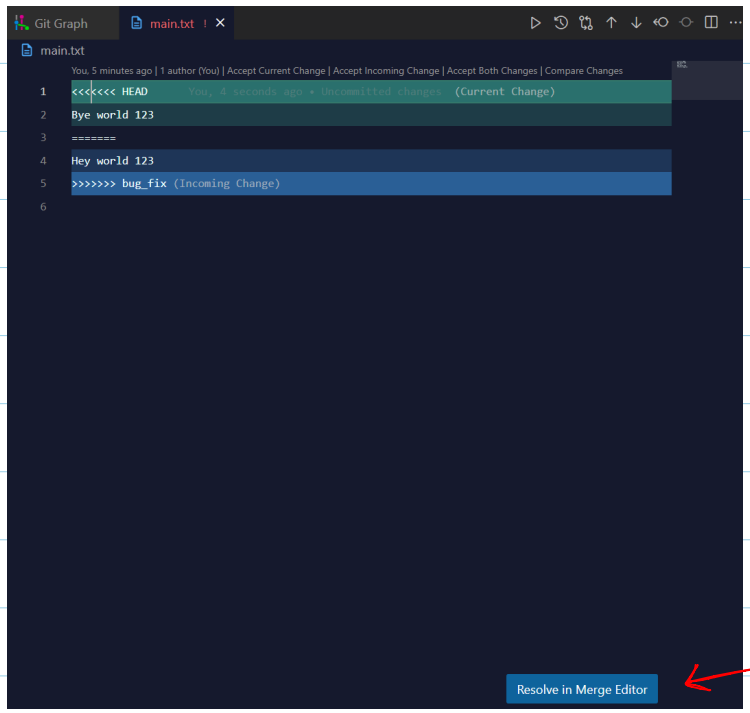

→ But what change should we keep in resultant file

⇒ This is called a Merge Conflict

```
PS D:\Git_Mastery\Git_Practiece> git merge bug_fix -m "Merging bug_fix and main"
Auto-merging main.txt
CONFLICT (content): Merge conflict in main.txt
Automatic merge failed; fix conflicts and then commit the result.
PS D:\Git_Mastery\Git_Practiece>
```

that is a Merge Conflict ←

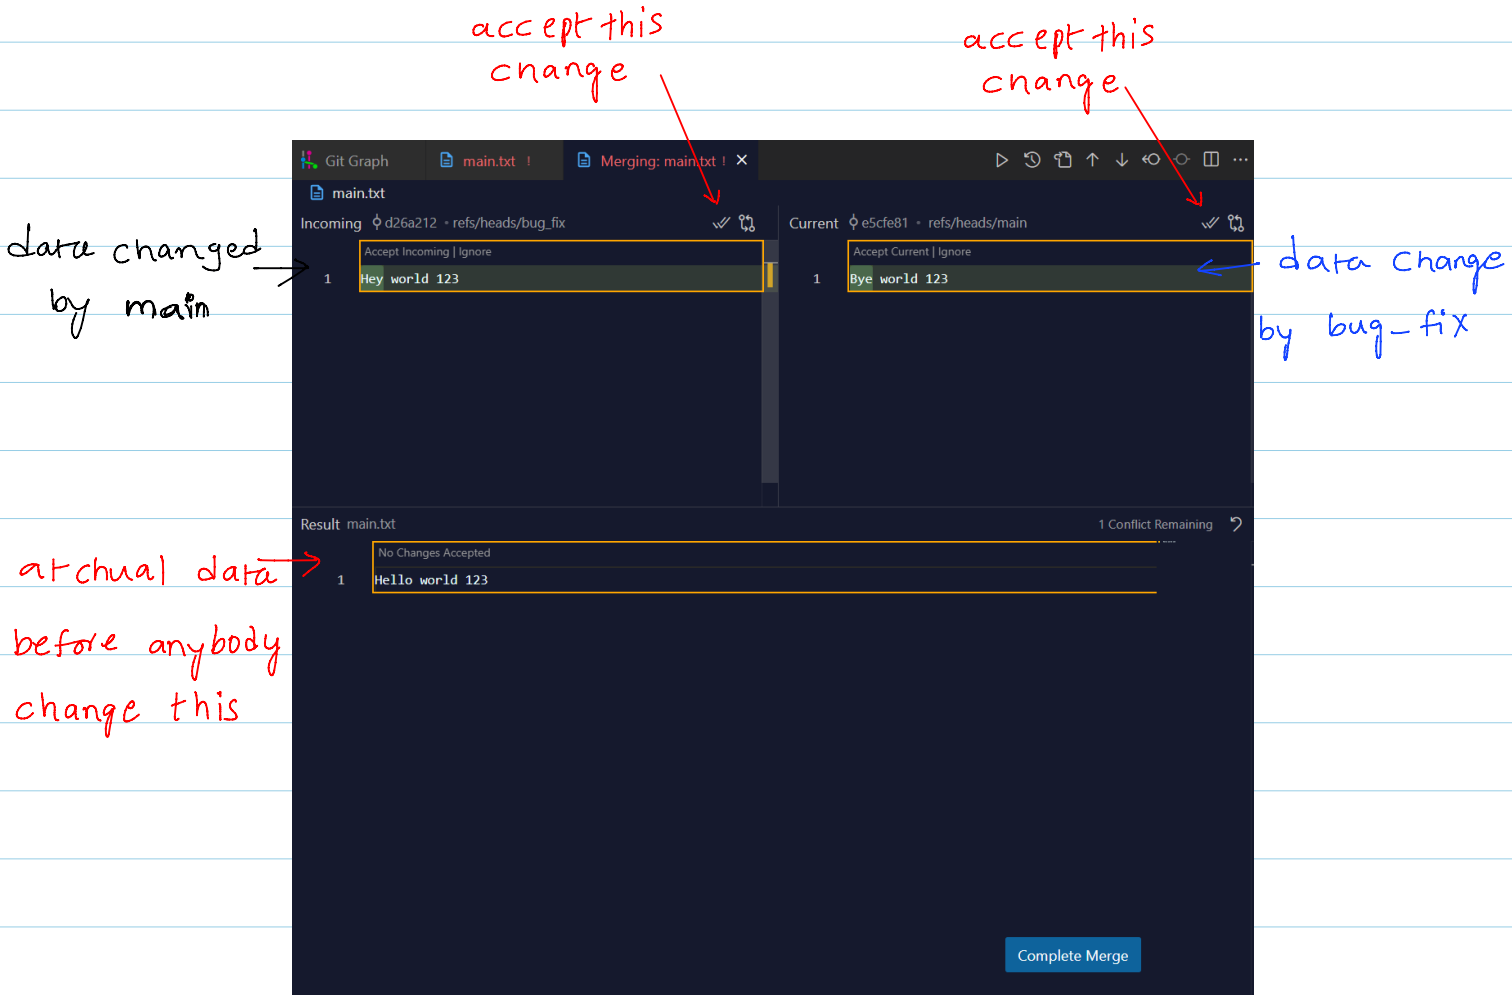

→ These Merge conflicts are generally resolve d Manually there is No other option

→ this is how it will look in VS code

→ if we want to fix that manually click on this

→ that will open an editor like this ↓

→ So finally we have 4 options to choose

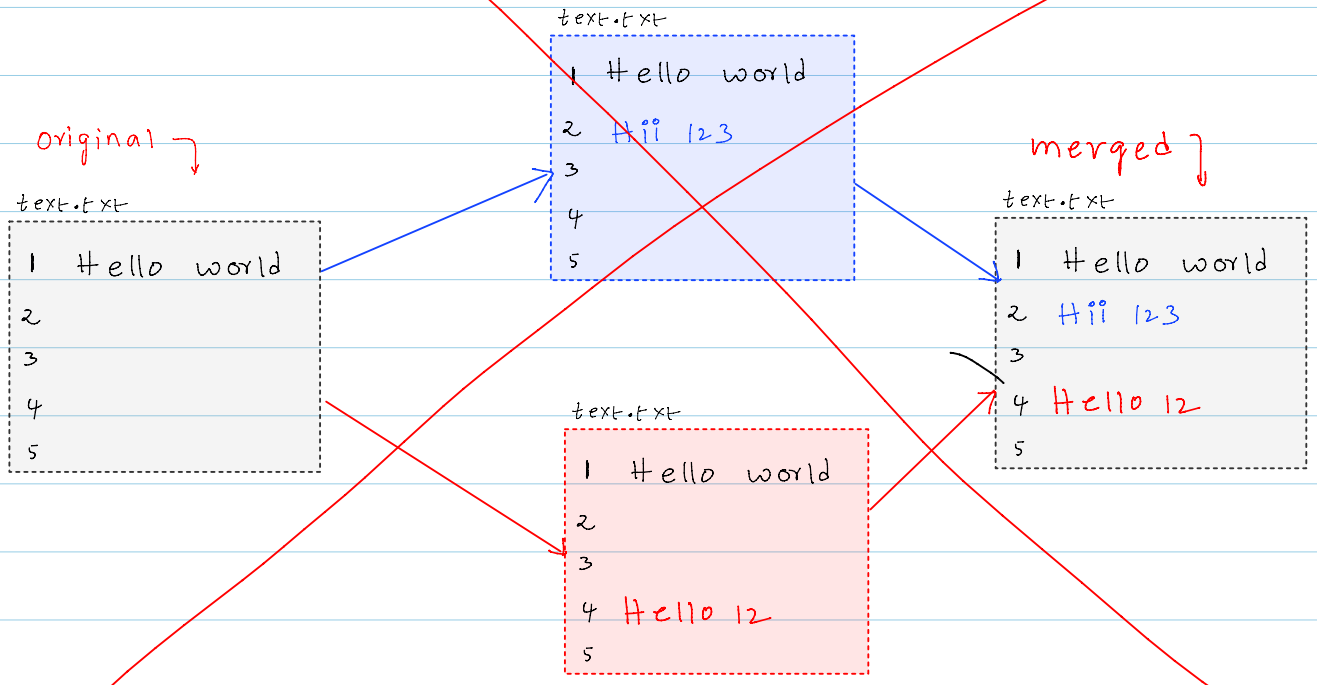

1) accept left
2) accept right
3) accept left & right
4) keep like previous (unchanged)

→ and more priority will be given to main branch

Senario -2

→ merge conflict only occur when two branches changes the same line in a common file

→ let see a senario where change in same file but there is No Conflict

→ Now there is No problem because changes are in different lines.
