Types of Git Merge

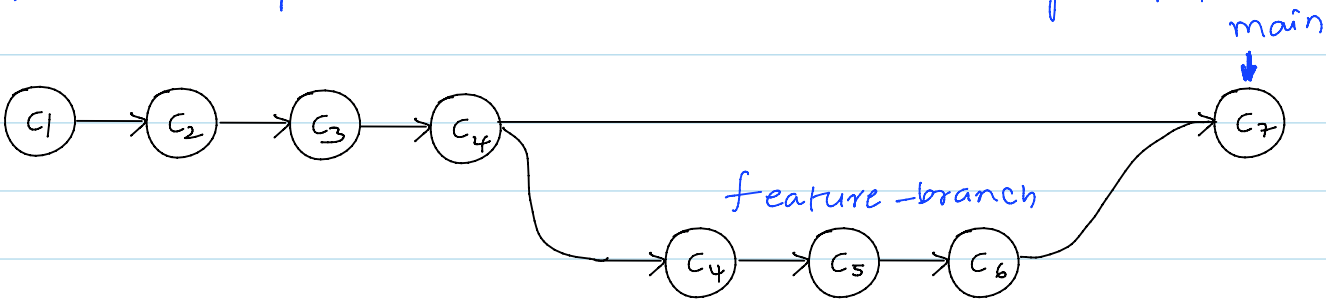

1) Fast forward Merge:

→ This is a very simple Merge where the main pointer wont updated, but the branch is being progressed

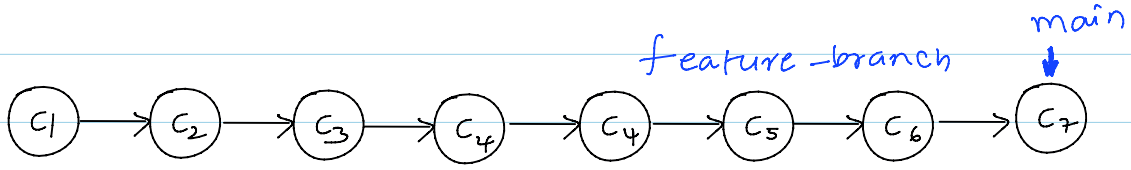

→ after we do a Merge that look a linear line.

→ after merge the main branch still looking empty

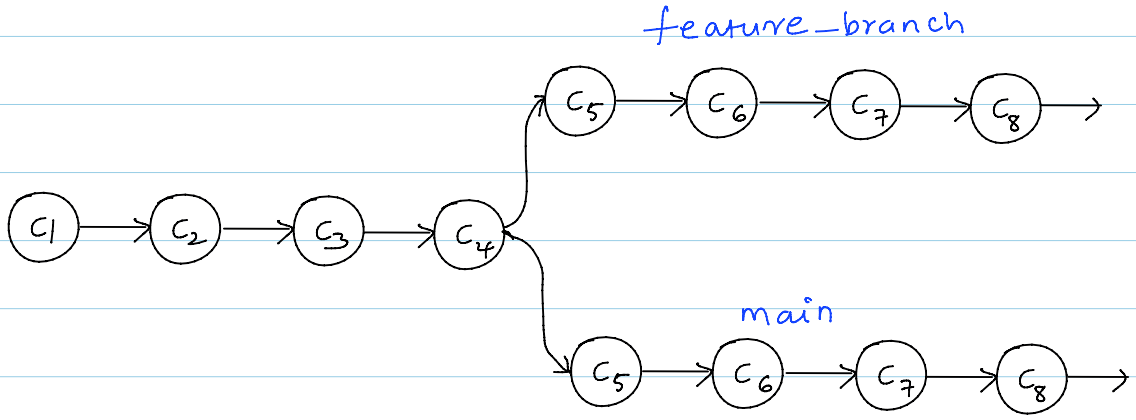

→ so we can say the new branch like this

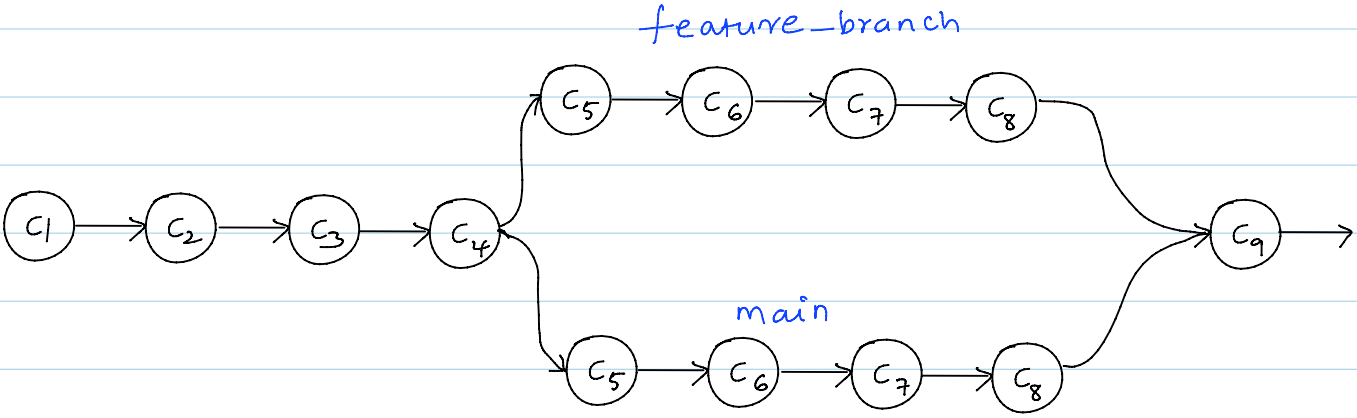

→ in fast forward merge we don't need any merge commit

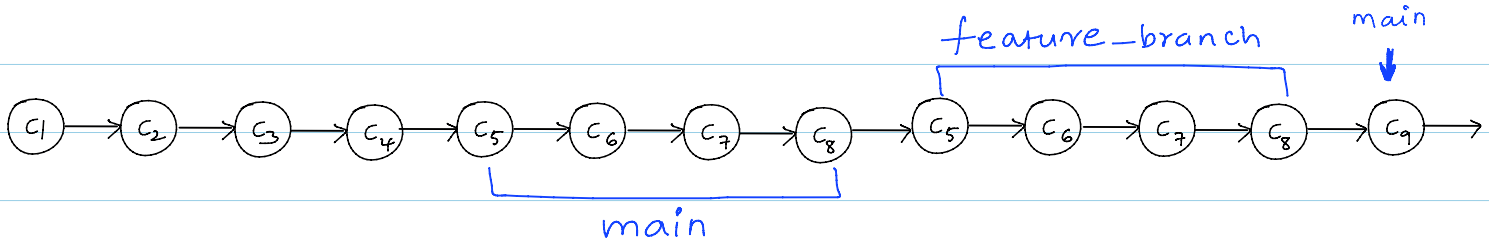

2) Three way Merge :-

→ in a three way merege we will be having 2 branches getting progress at the same time so if there are No conflicts that would be merged

→ If there are No conflicts it will be merging like below

→ After merging it will atchully look like this

→ here in 3 way Merge we need a merge commit with message
